

Cutouts

Some queries require portion of an image (cutout). This page attempts to capture what the expectations and needs are.

Query006 requires cutouts of galaxies from full color image.

Transient/variable stars science collaboration requested cutouts of variable objects. This will be useful for variable objects which show features that are not well fit by a psf model, (i.e. extended sources?) - in this case, the user would specify the epoch of interest. This would be one way to identify main belt comets - you look for moving objects which are not well-fit by a psf, and then visually inspect those objects (or a subset of those objects).
