

## Select all unresolved objects (stellar PSF) in a given region of sky, and return their attributes

Returned attributes should include: parallax, mags, proper motions, variability.

This query was suggested by the LSST Science Collaboration (Stellar Populations).

```
SELECT parallax, uMag, gMag, rMag, iMag, zMag, yMag, muRA, muDecl,
       uVarProb, gVarProb, rVarProb, iVarProb, zVarProb, yVarProb
FROM   Object
WHERE  areaSpec(:raMin, :declMin, :raMax, :declMax)
       AND extendedParameter < 0.2
```
